

# Wildlife Response to Forest Structure

**Clint Smith**  
**Wildlife Biologist**  
**Tillamook District**  
**Oregon Department of Forestry**

# Talking Points

- We don't know all the answers
- We never will know all the answers
- No matter what you do, there will be winners and losers
- The best way to maximize biodiversity is to maximize habitat diversity:
  - at both the coarse - and fine - scales
- Decadence is the key to providing for many wildlife species
- Always hedge your bet!

# Talking Points

**If you do the same thing everywhere,**

**No matter what you do,**

**You're not diversifying.**

# Ecological Niche

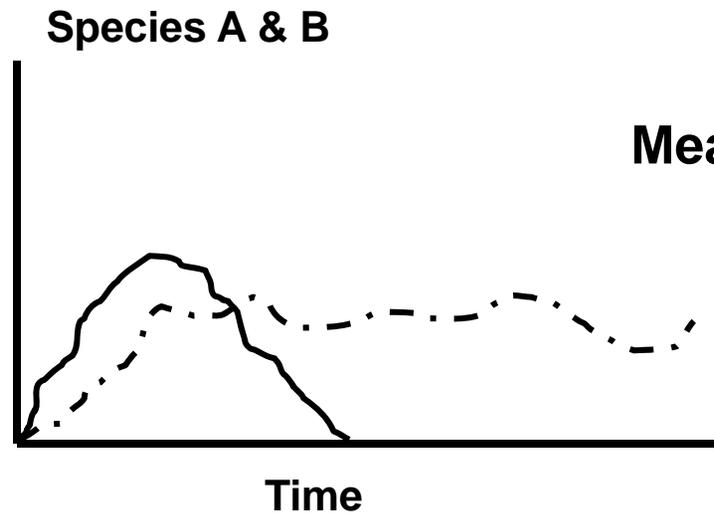

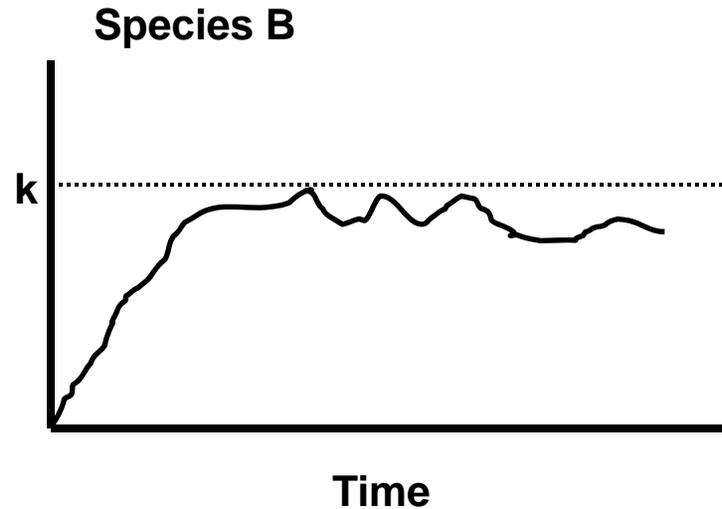

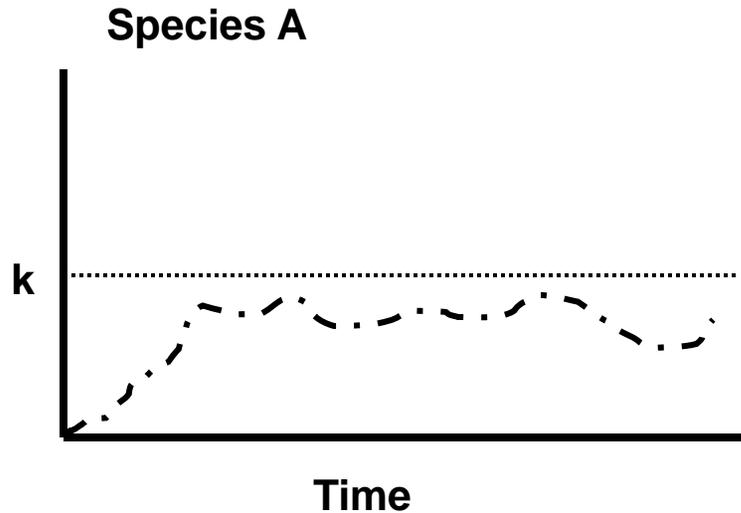

A particular combination of physical factors (microhabitat) and biotic relations (role) required by a species for its life activities and continued existence in a community

**OR**

What the species “does for a living”

# Competitive Exclusion

Mealworm Populations

# Competitive Exclusion

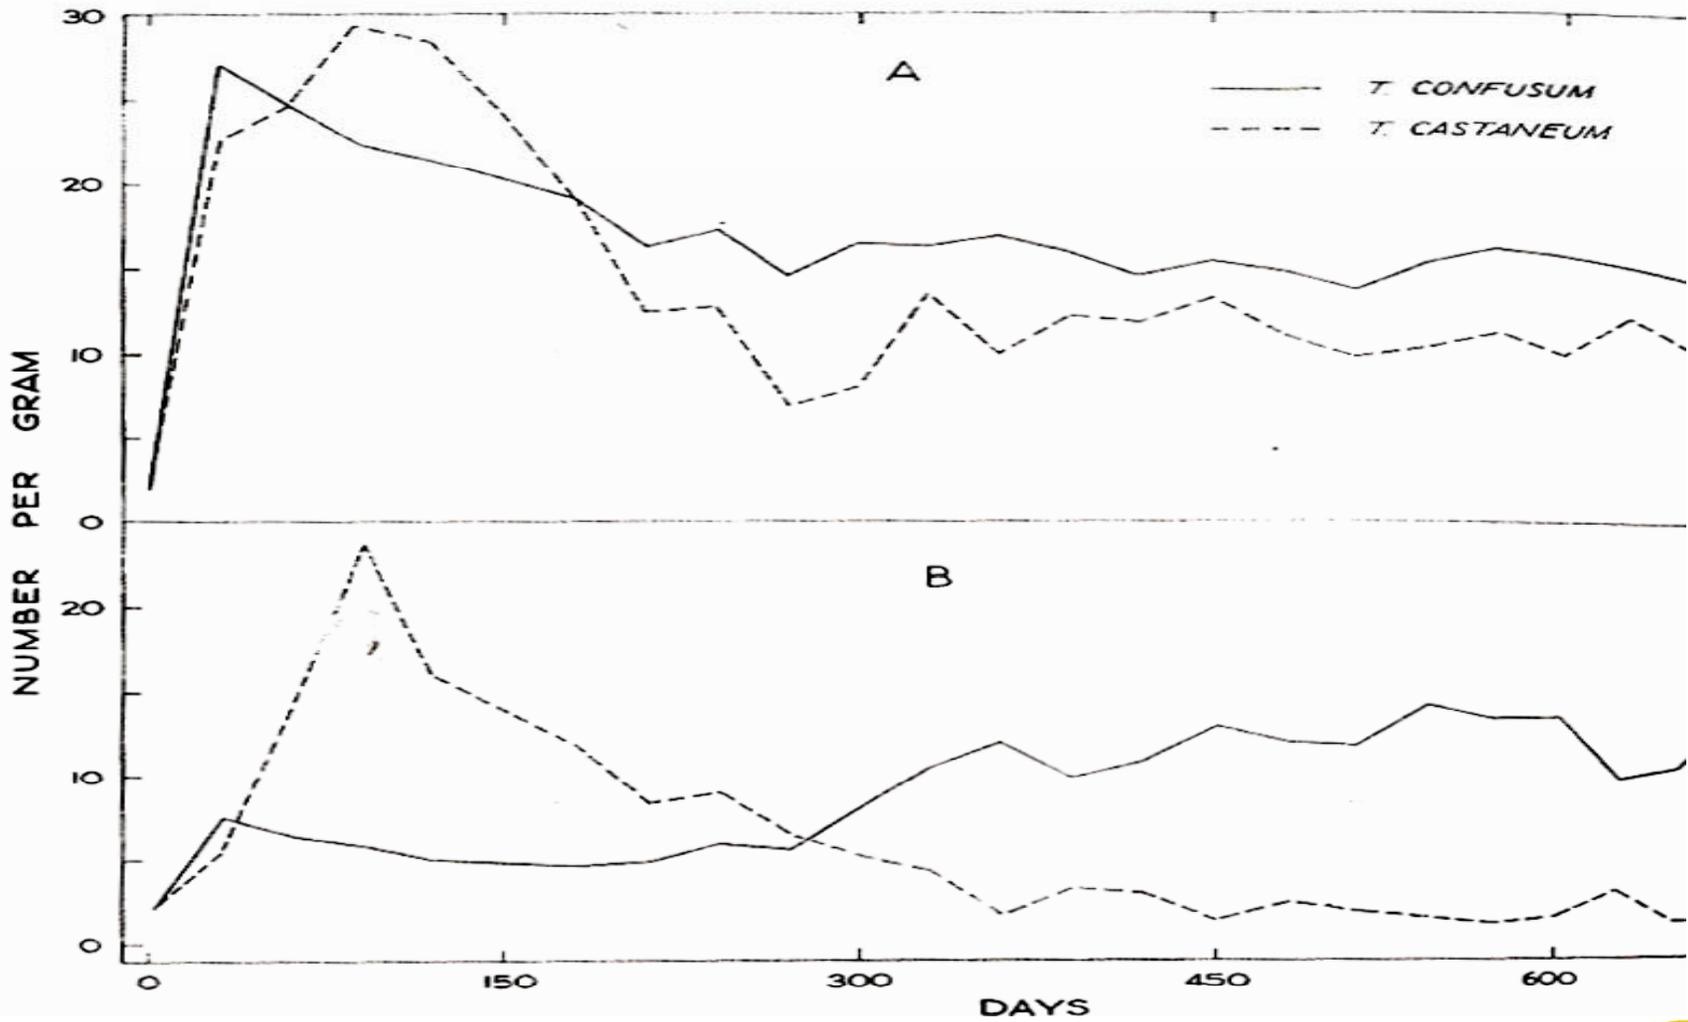

An ecological niche cannot be simultaneously and completely occupied by stabilized populations of more than one species

**OR**

Two or more species with closely similar niche requirements cannot exist indefinitely in the same area.

Example: Spotted Owl ↔ Barred Owl

# Spotted Owl

**BLM – ODF Thinning Training**

**Silver Falls Conference Center**

# Why are there so many different kinds of animals?

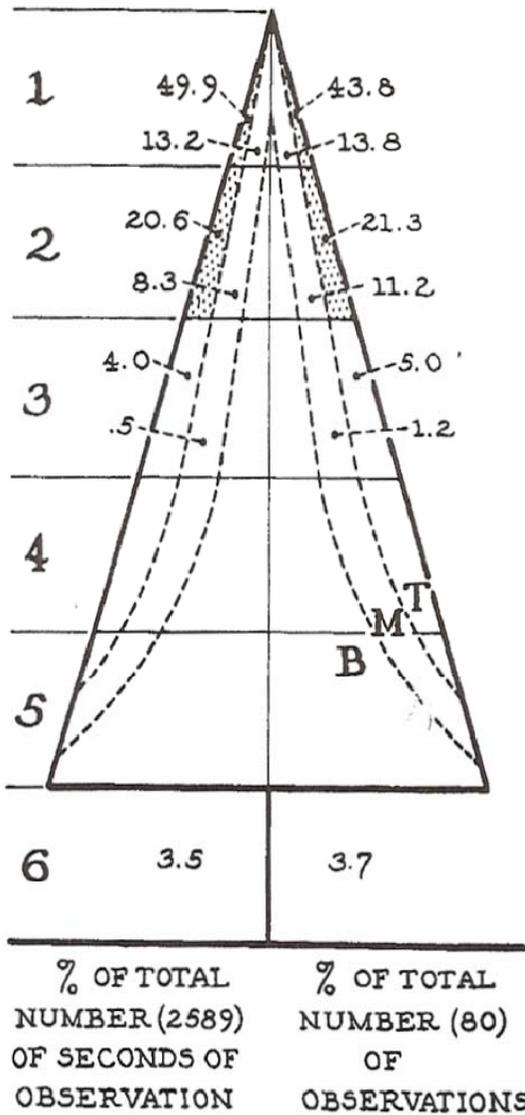

# Two species with similar niche requirements meet in competition under natural conditions:

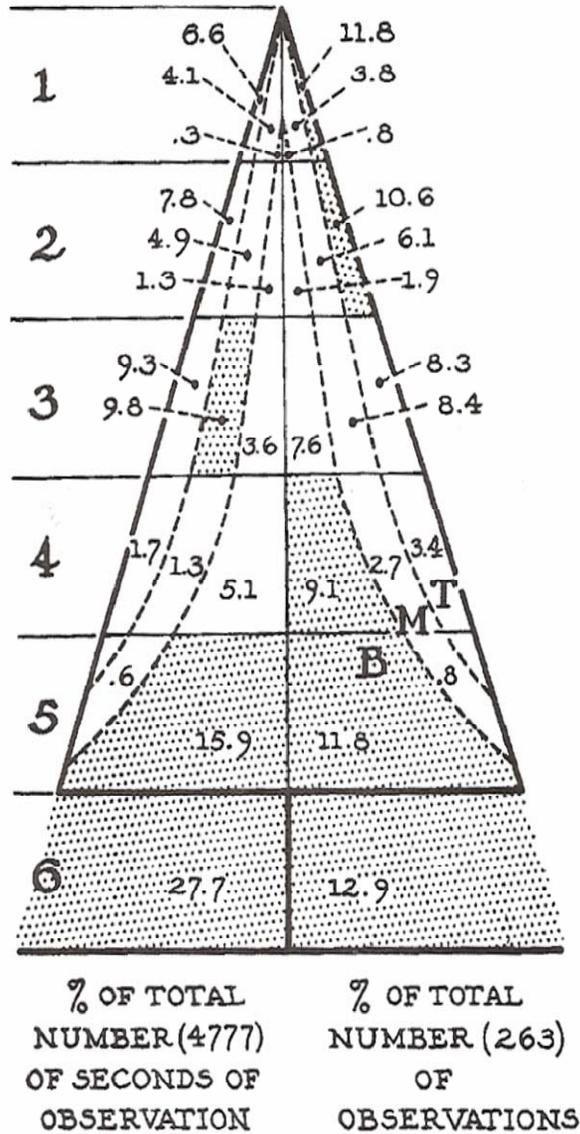

- **One species is better adapted overall**
  - Will spread rapidly throughout the range of the other.
  - Competitive exclusion.
- **One species is better adapted to a portion of the range**
  - The other species is better adapted to the remainder of the range.
  - The two species occupy separate, but adjacent ranges.
- **Each species is better adapted to a different portion of the niche**
  - Both species occupy similar ranges.
  - Each species occurs within different microhabitats.

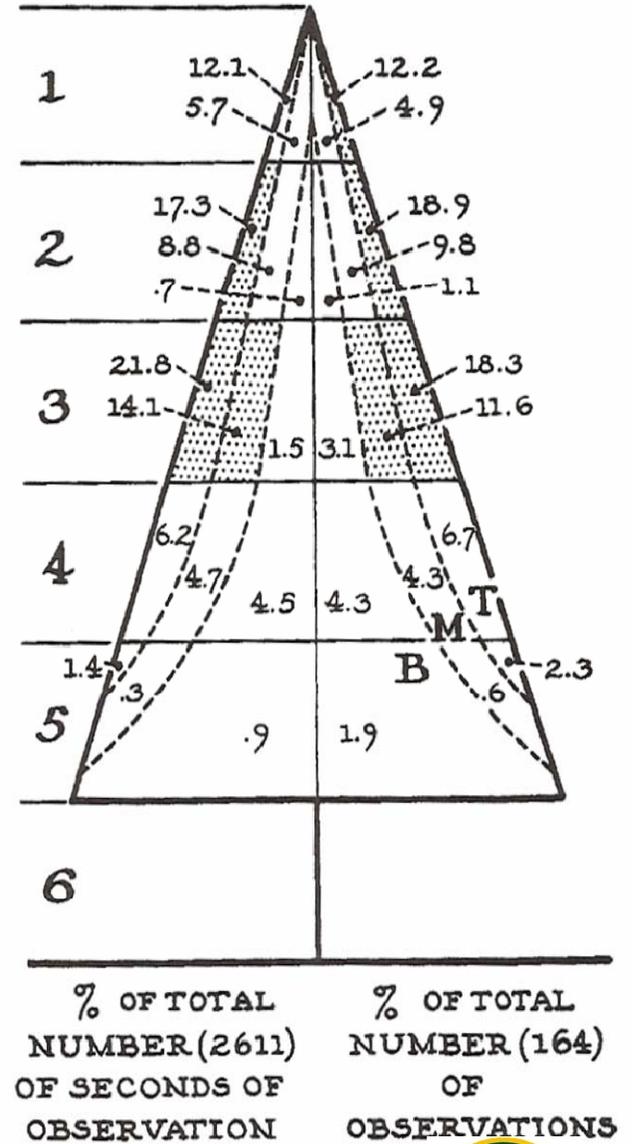

### Cape May warbler

### Myrtle warbler

### Black-throated green warbler

# Nesting Height of Warblers

# Foraging Niches of Birds in the Montane Forests

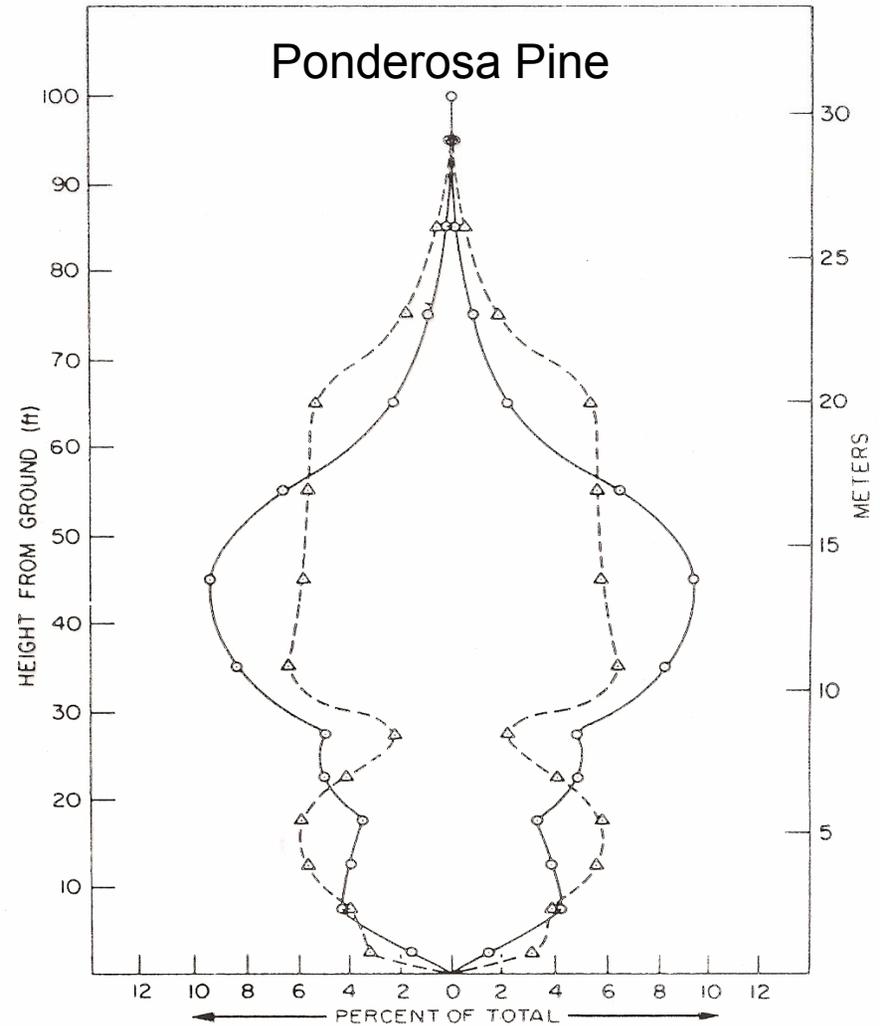

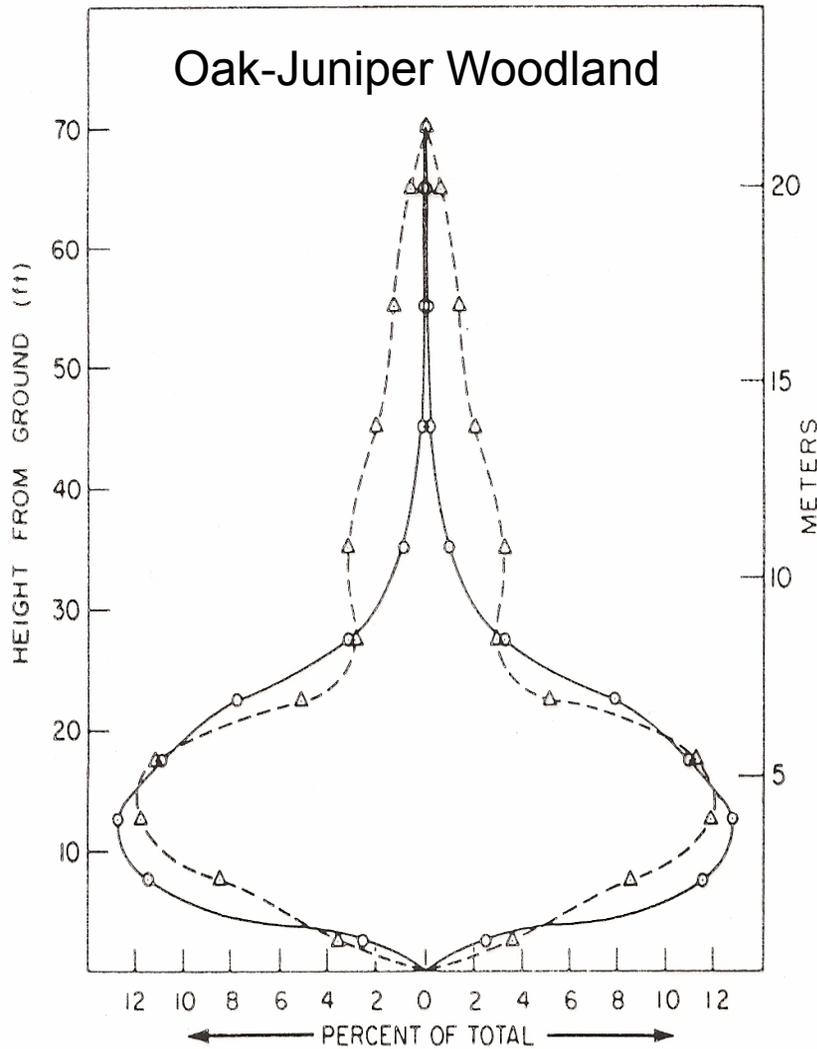

# Conclusion

**More structurally complex forests  
(fine scale/within stand diversity)  
support greater wildlife species  
diversity than do forests with  
simple structure.**

# Use by all bird species of tree foliage

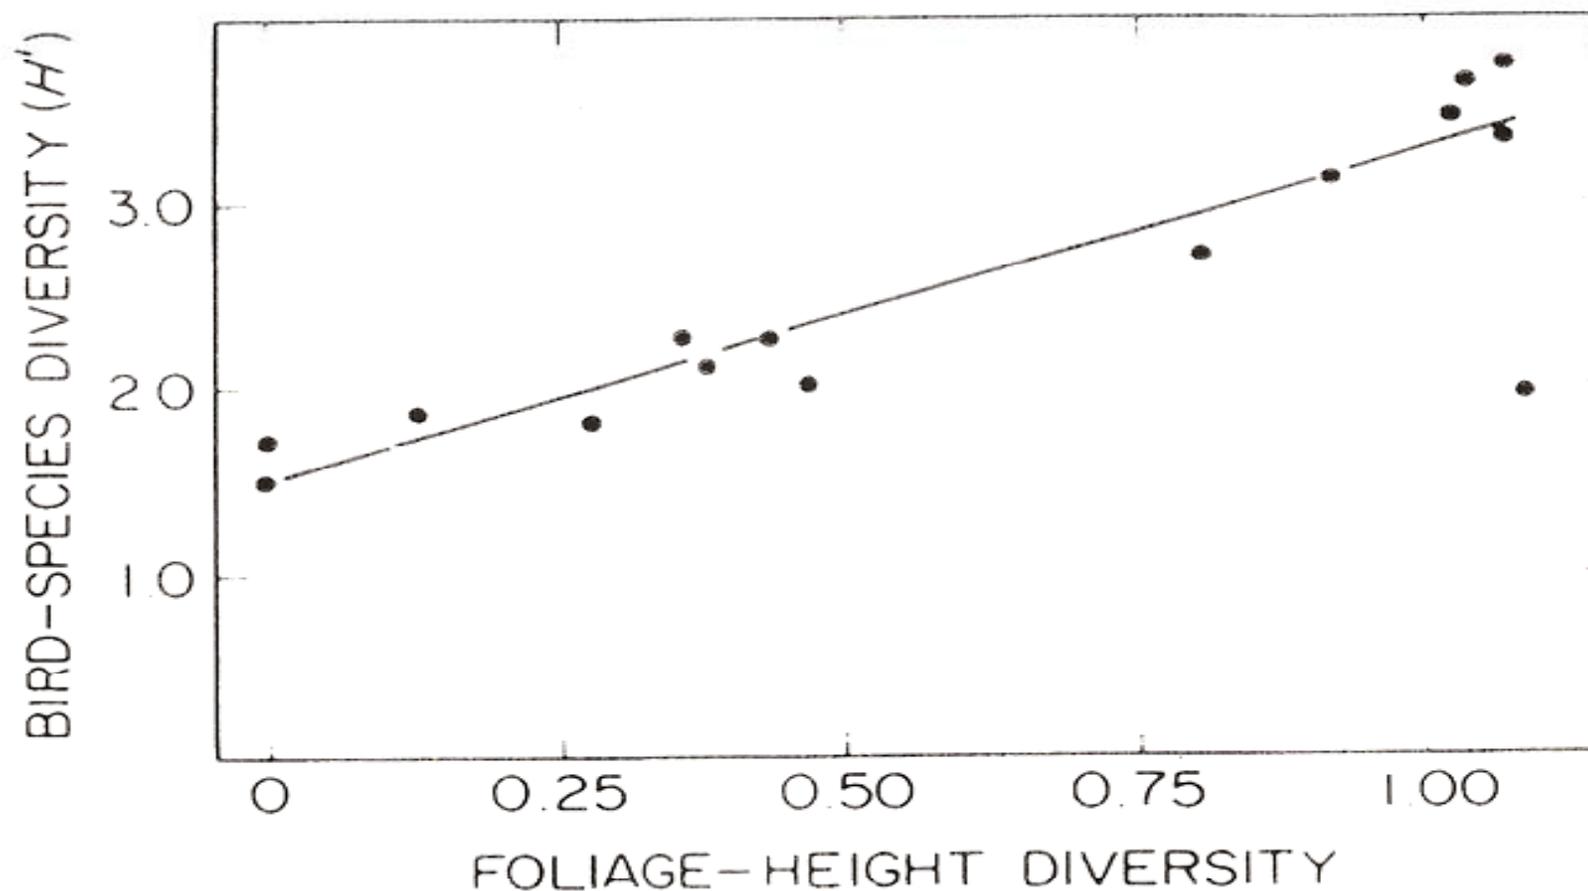

Fig. 16-13 Regression of bird-species diversity on foliage-height diversity (Karr and Roth 1971).

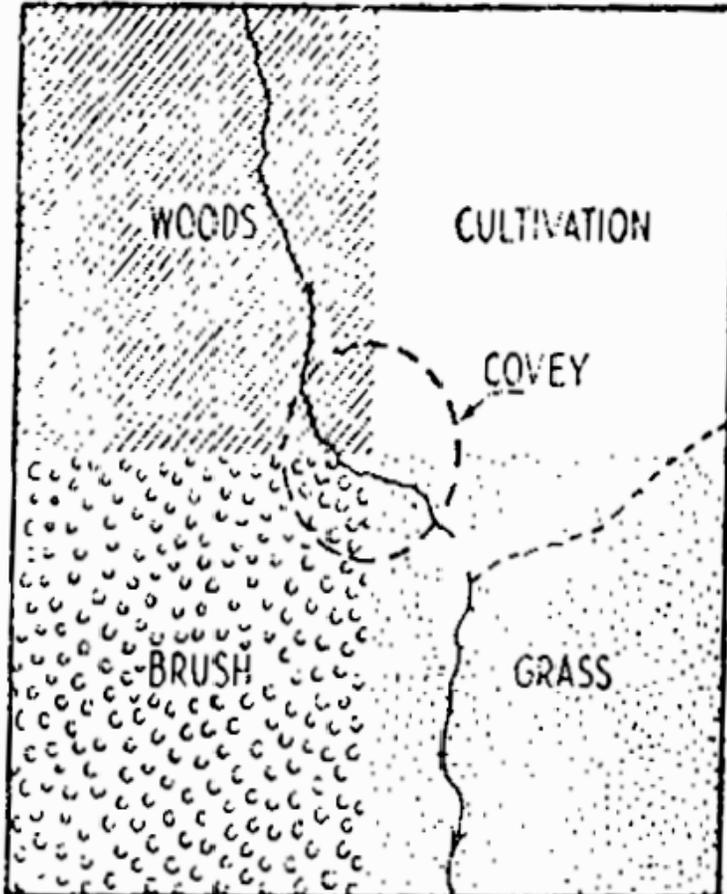

# Course scale diversity over the landscape results in increased wildlife species diversity

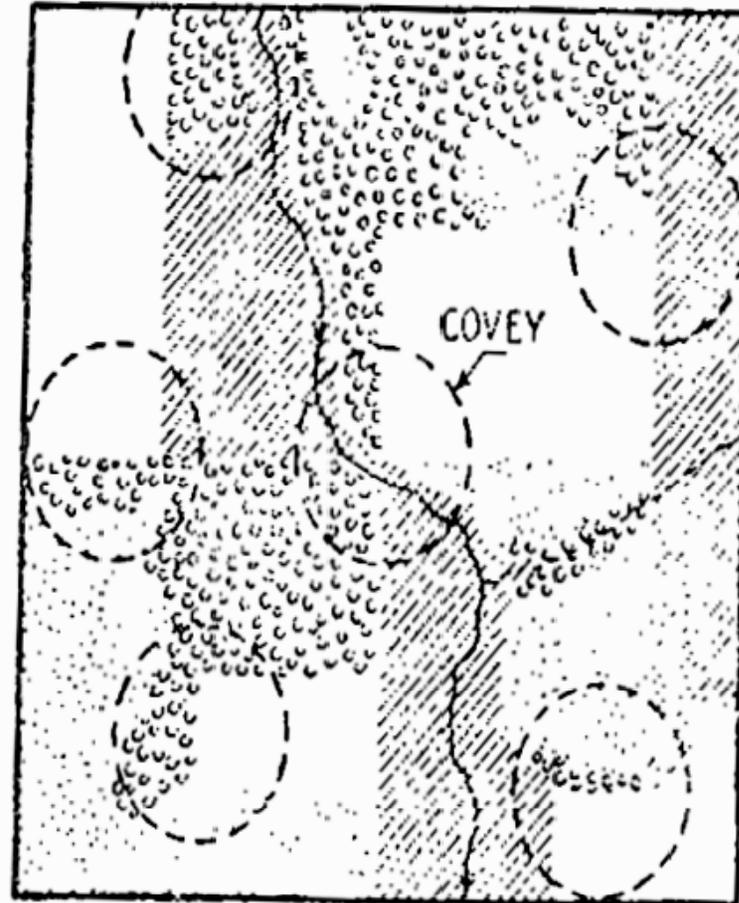

# Quail Covey Locations

Poor Interspersion (1 Covey)

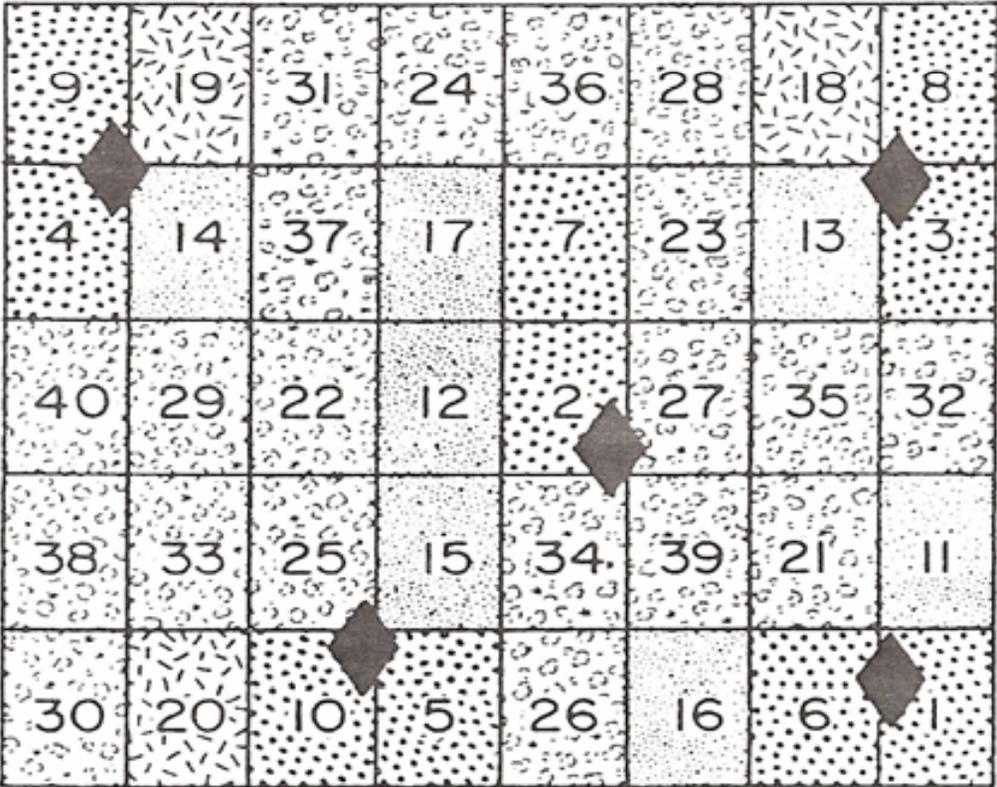

Good Interspersion (6 Coveys)

# Ruffed Grouse Drumming Sites

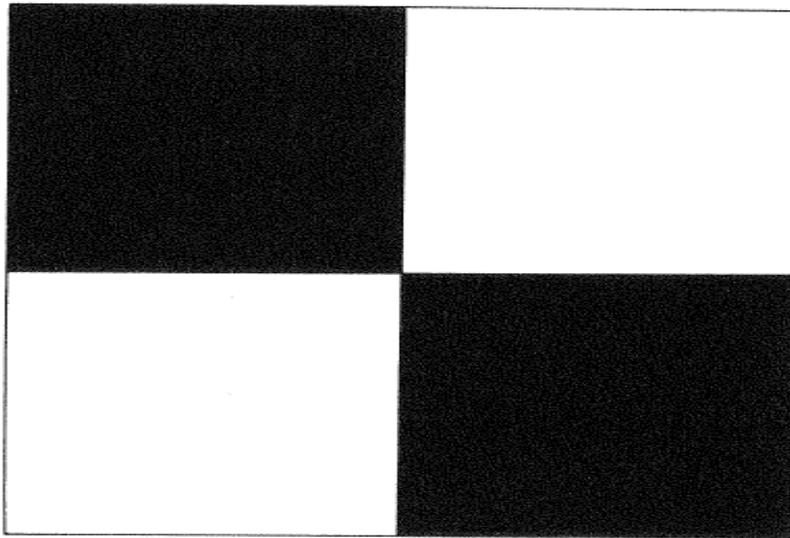

40 Acre Aspen Stand

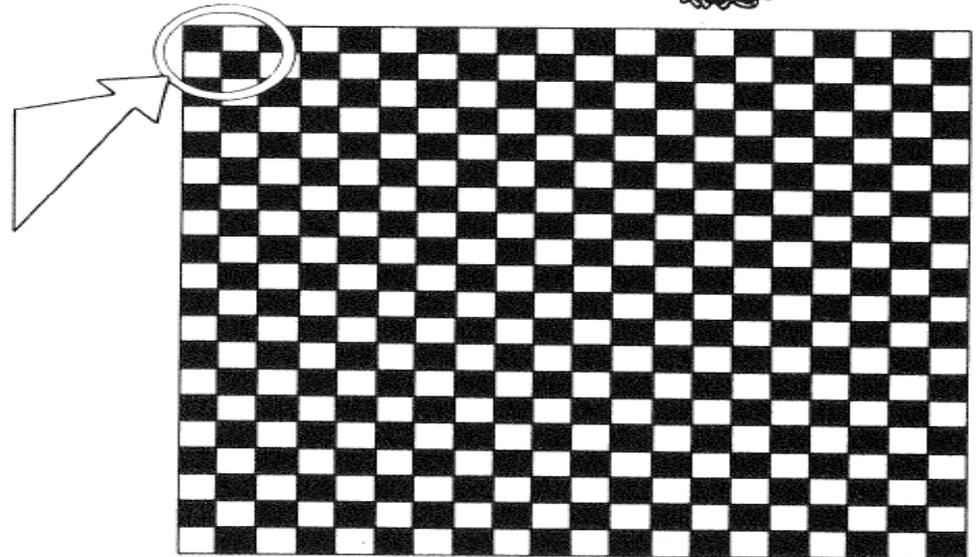

-  Recently Cut
-  Sapling Stand
-  Small Pole Stand
-  Original Forest
-  Expected Location of a Ruffed Grouse Drumming Site

# Scaled Perception

4 ha

400 ha

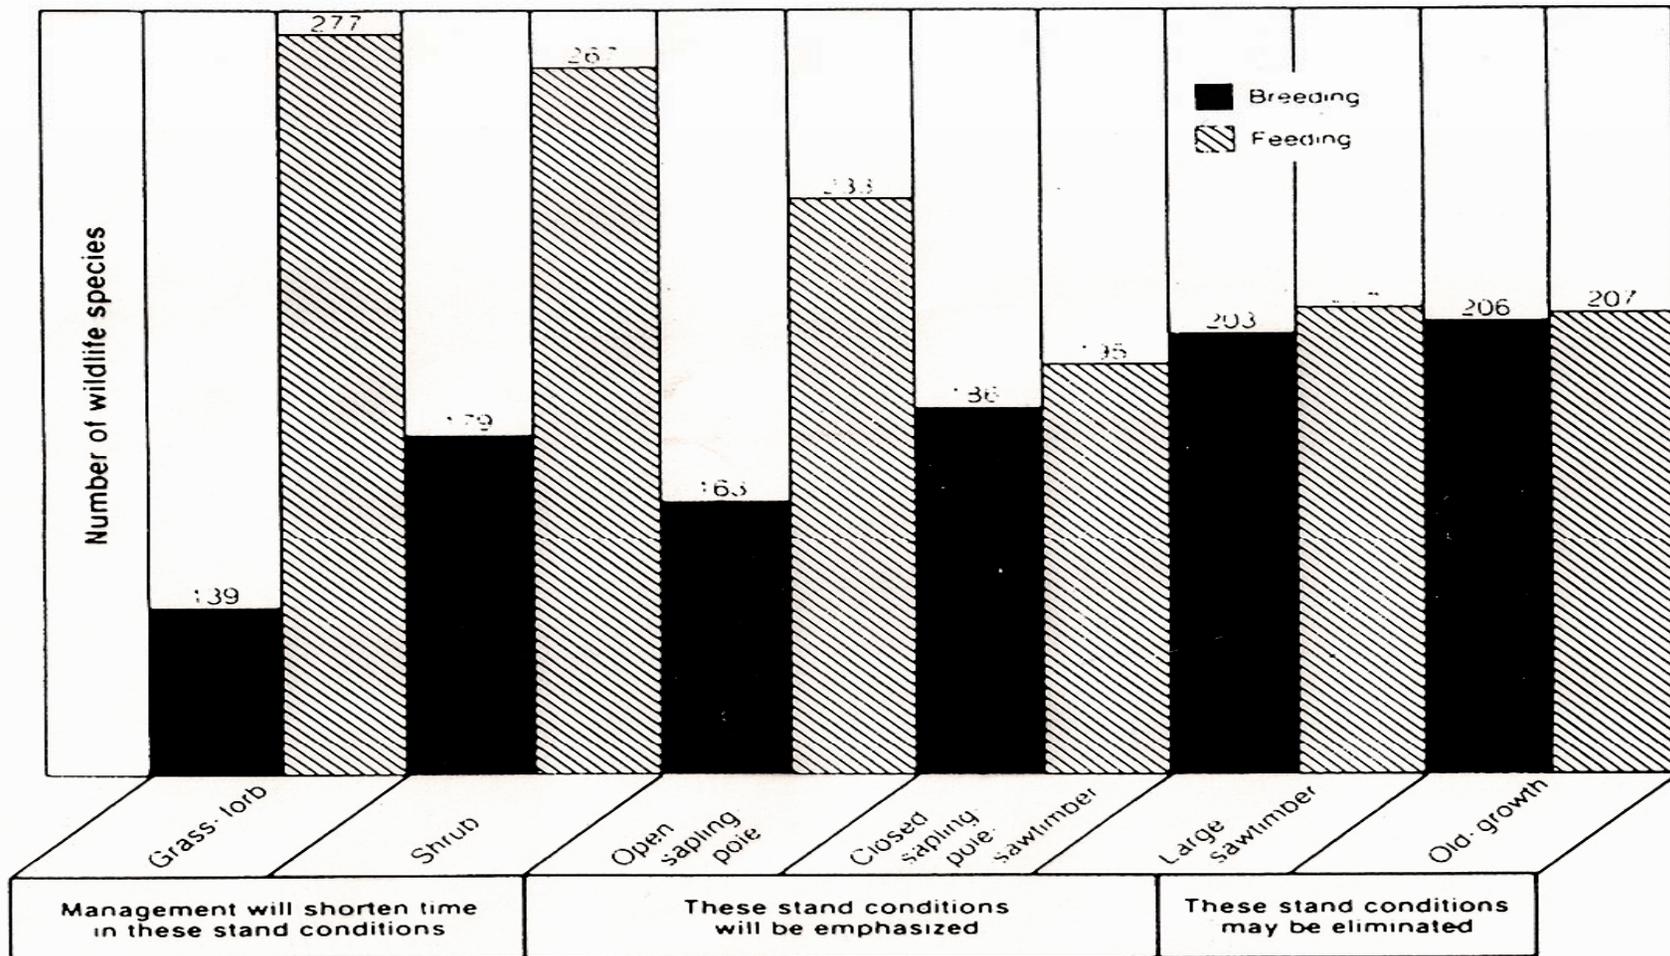

**Figure 6.1** In each block the individual cells represent 1 ha of 60-year-old forest (black) or 5-year-old forest (white). The left figure represents the scale of perception of a yellow-rumped warbler; the right represents an American kestrel's scale. (Redrawn from Hunter 1986)

# Structure Based Management

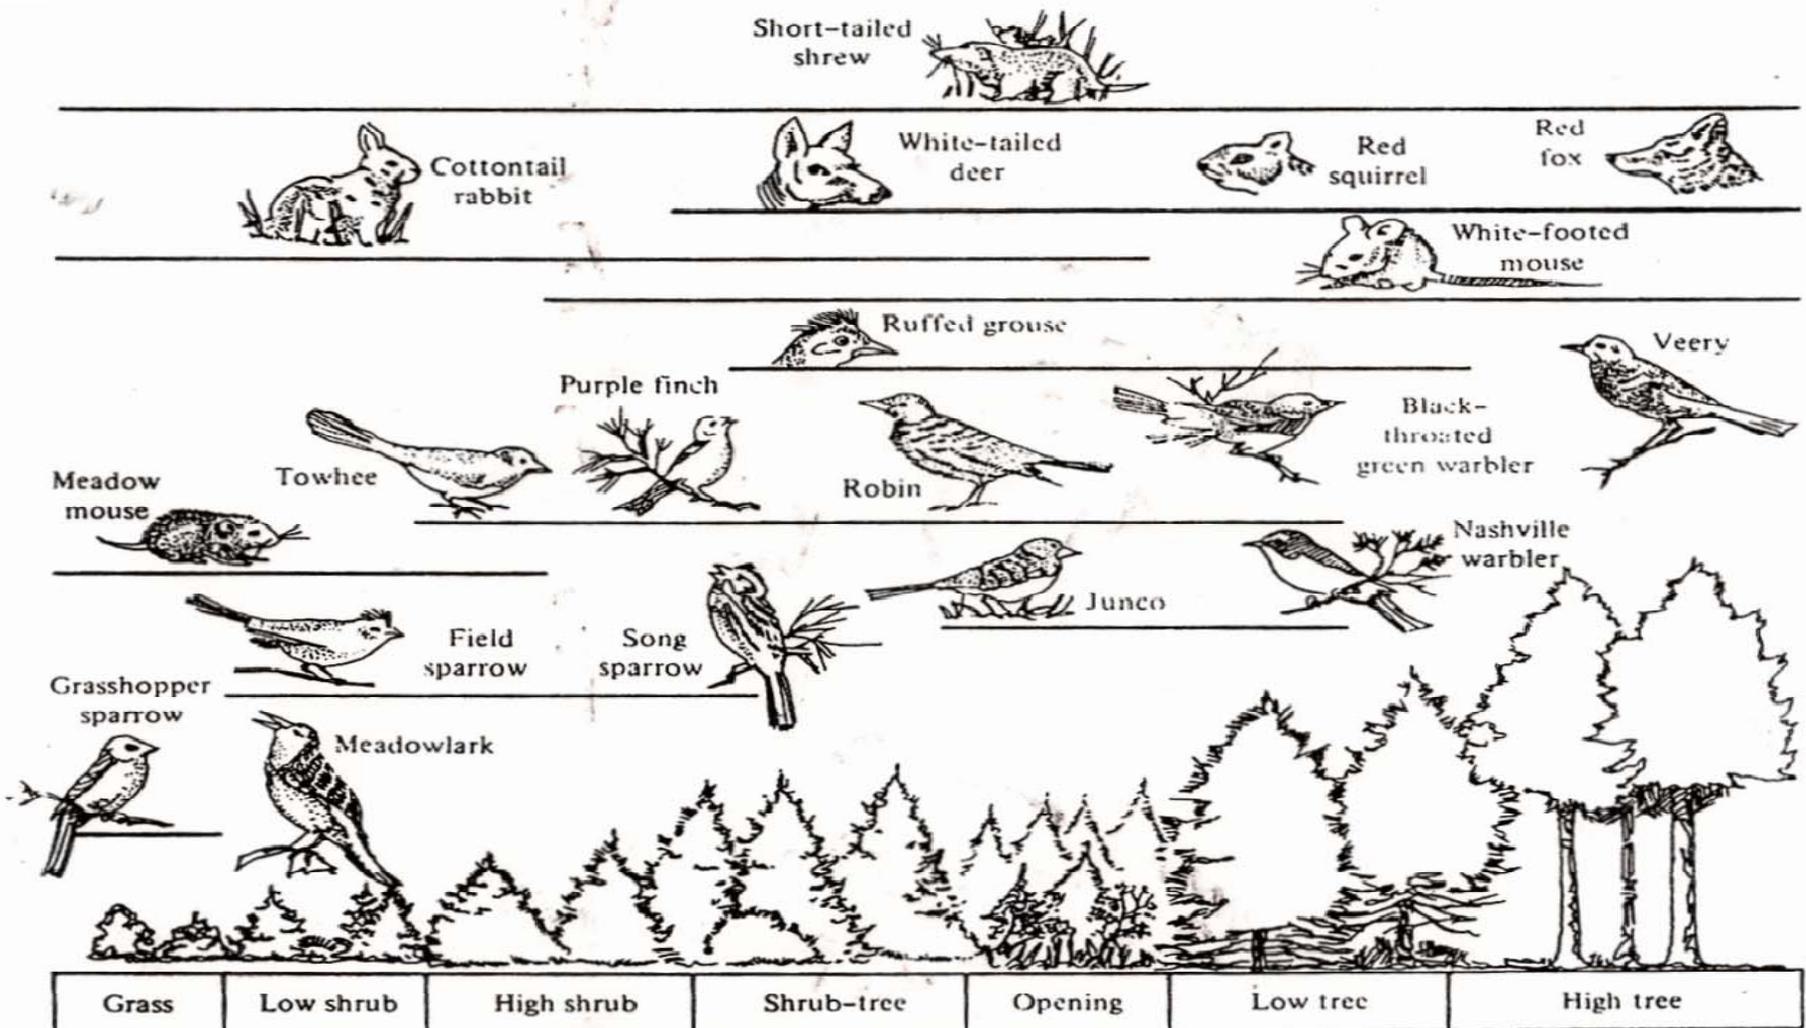

- **Diversity of Stand Structure Types**
  - Regeneration
  - Closed Single Canopy
  - Understory
  - Layered
  - Older Forest Structure
- **Include wildlife habitat components within stands**
  - Layering
  - Decadence
    - Snags
    - Down wood
    - Old growth trees
  - Tree Species Diversity
    - Including hardwoods
  - Herb Shrub Consideration
  - Gaps
- **Landscape Design**
  - Mini-fragmentation
  - Maxi-fragmentation

# Number of wildlife species oriented to each stand condition and the potential effects of intensive timber management

# Sequence of animals associated with different structures in a pine plantation

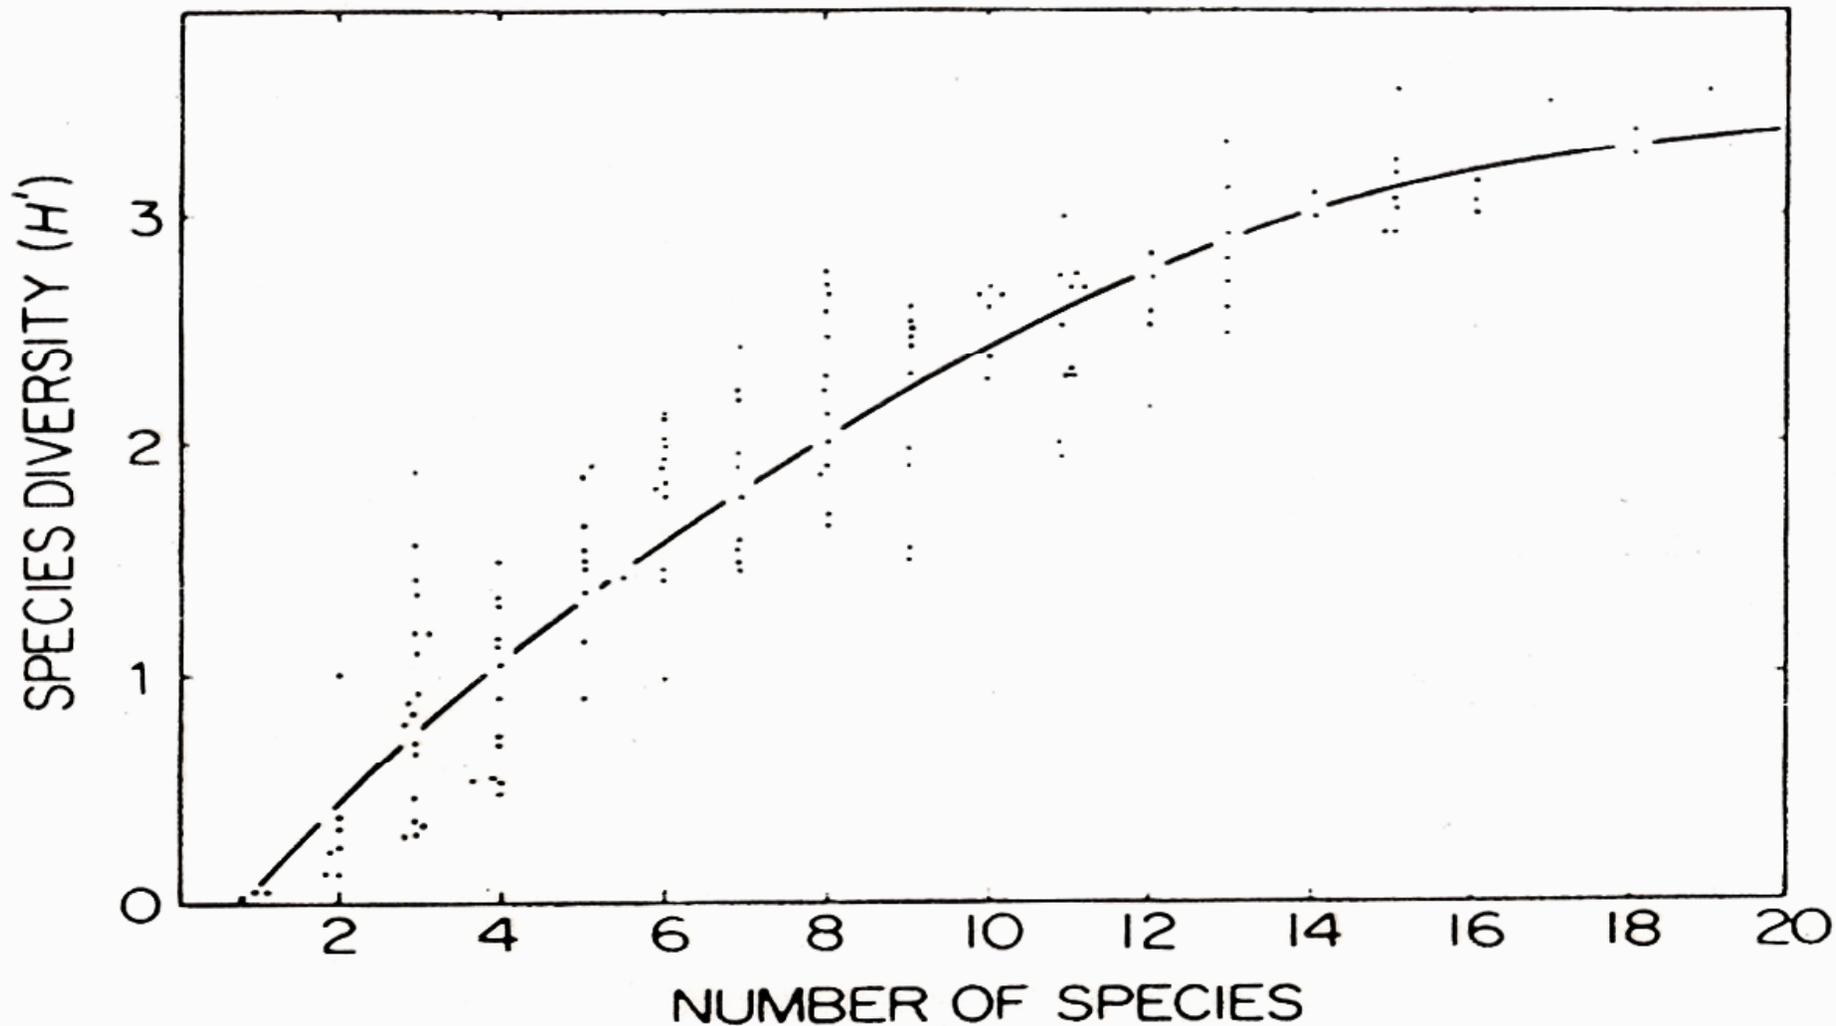

Fig. 16-8 Relation of the species diversity index to the number of tree species (from Monk 1967).

# Bird communities in commercially thinned and unthinned Douglas-fir stands of western Oregon

*Joan C. Hagar, William C. McComb, and William H. Emmingham*

**Abstract** We compared abundance and diversity of breeding and winter birds between commercially thinned and unthinned 40- to 55-year-old Douglas-fir (*Pseudotsuga menziesii*) stands in the Oregon Coast Ranges. Abundance of breeding birds was greater in thinned stands. Bird species richness was correlated with habitat patchiness and densities of hardwoods, snags, and conifers. During the breeding season, Hammond's flycatchers (*Empidonax hammondi*), hairy woodpeckers (*Picoides villosus*), red-breasted nuthatches (*Sitta canadensis*), dark-eyed juncos (*Junco hyemalis*), warbling vireos (*Vireo gilvus*), and evening grosbeaks (*Coccothraustes vespertinus*) were more abundant in thinned than unthinned stands. Pacific-slope flycatchers (*Empidonax difficilis*) were more abundant in unthinned stands. Golden-crowned kinglets (*Regulus satrapa*), gray jays (*Perisoreus canadensis*), and black-throated gray warblers (*Dendroica nigrescens*) were more abundant in unthinned than thinned stands, but these patterns were inconsistent between seasons, regions, or years. Stand-scale habitat features were associated with the abundance of 18 bird species.

# Mechanisms

- Insect Diversity

# Mechanisms

- Decadence / Cavities

# Mechanisms

- Fruit-producing trees & shrubs

# Mechanisms

- Stand Structure / Diversity
- “Overall...mixed red alder – conifer stands provided more heterogeneous structures than pure conifer stands, with more even diameter distributions, multiple canopy layers, and similar numbers of large diameter conifers.” (Deal et al. 2004)
- Provide characteristics of older forests.

# Ecosystem Management

- Inherent Disturbance Regimes

BLM – ODF Thinning Training

Silver Falls Conference Center

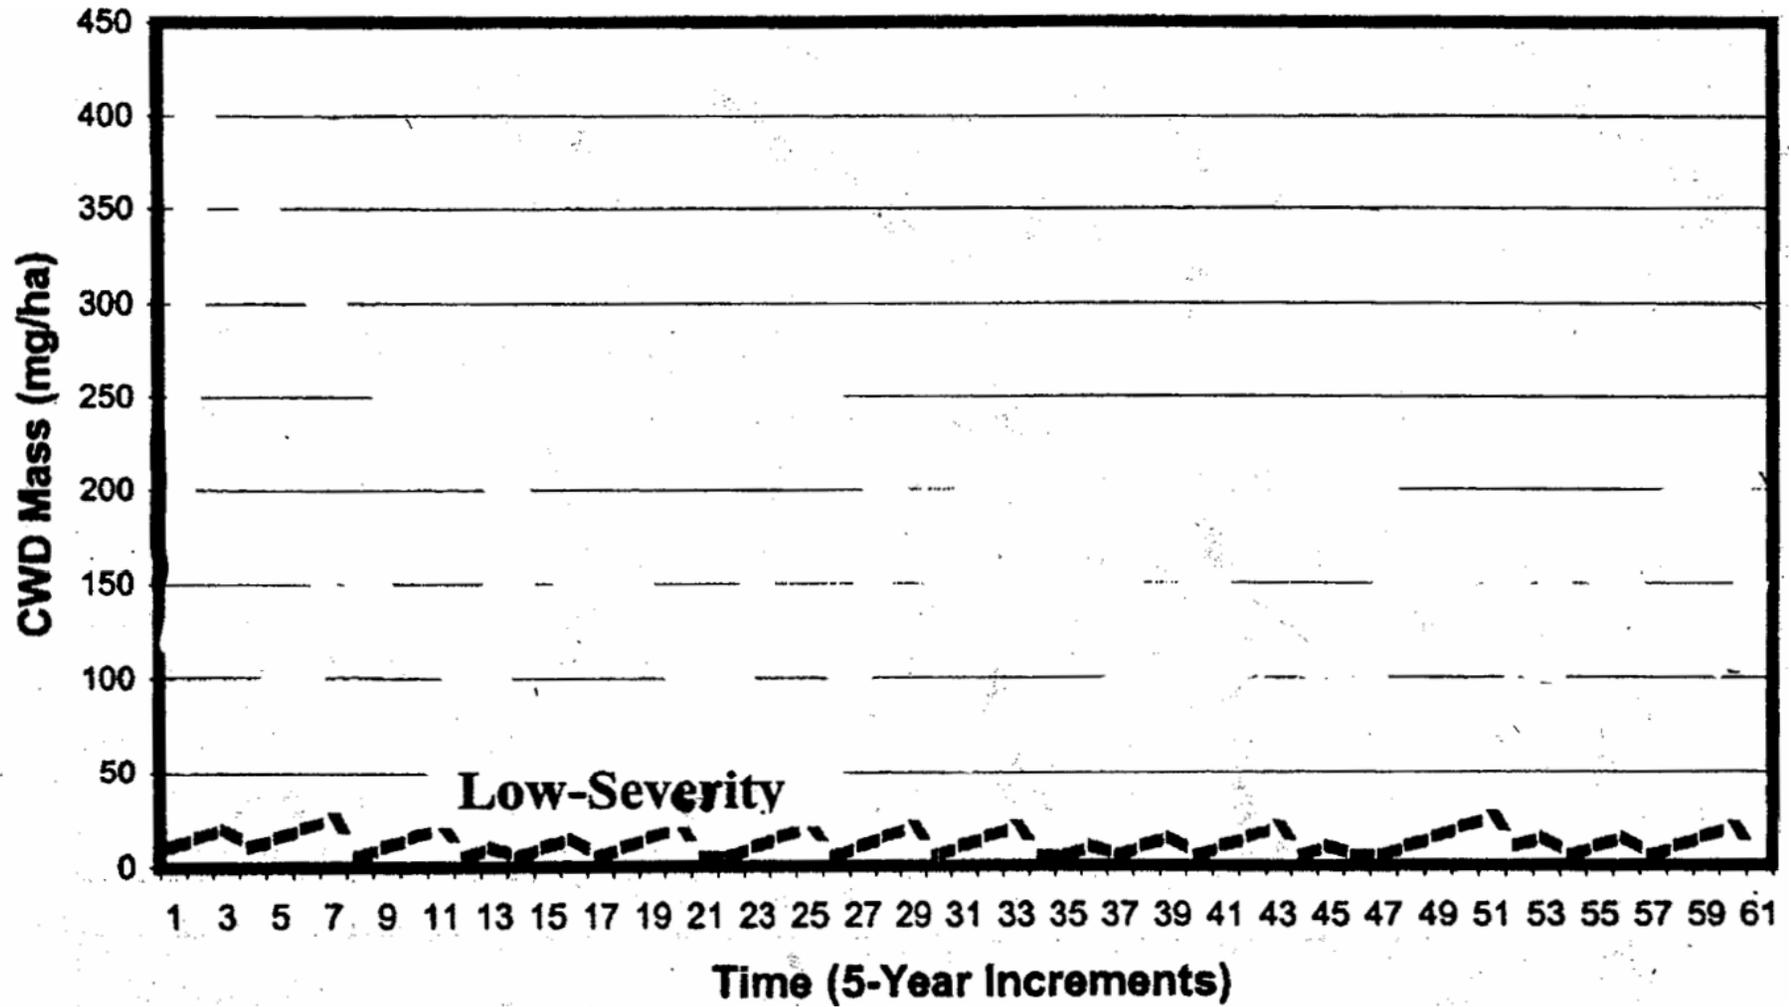

# Fire Regimes

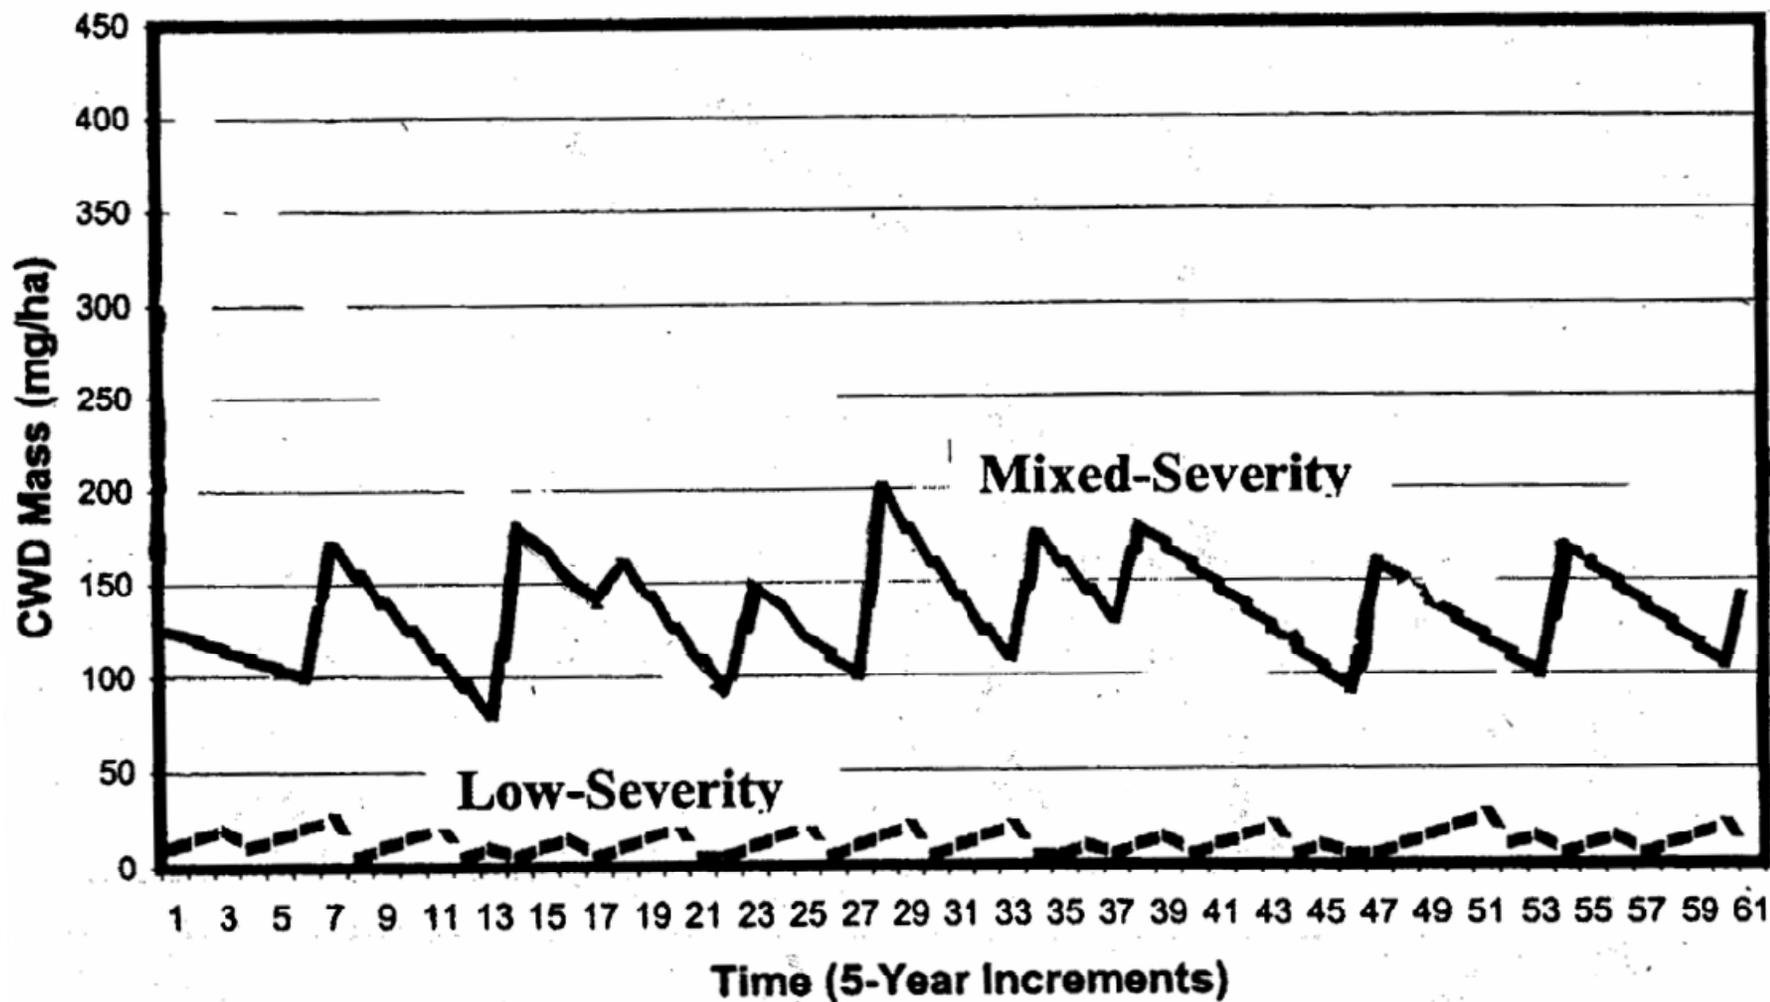

<u>Return Interval</u>	<u>Intensity</u>	<u>Example</u>
Frequent	Low	East-side Ponderosa Pine
Infrequent	High	Northwest Oregon D-fir / Hemlock
Mixed	Patchy	Southwest Oregon Mixed Conifer

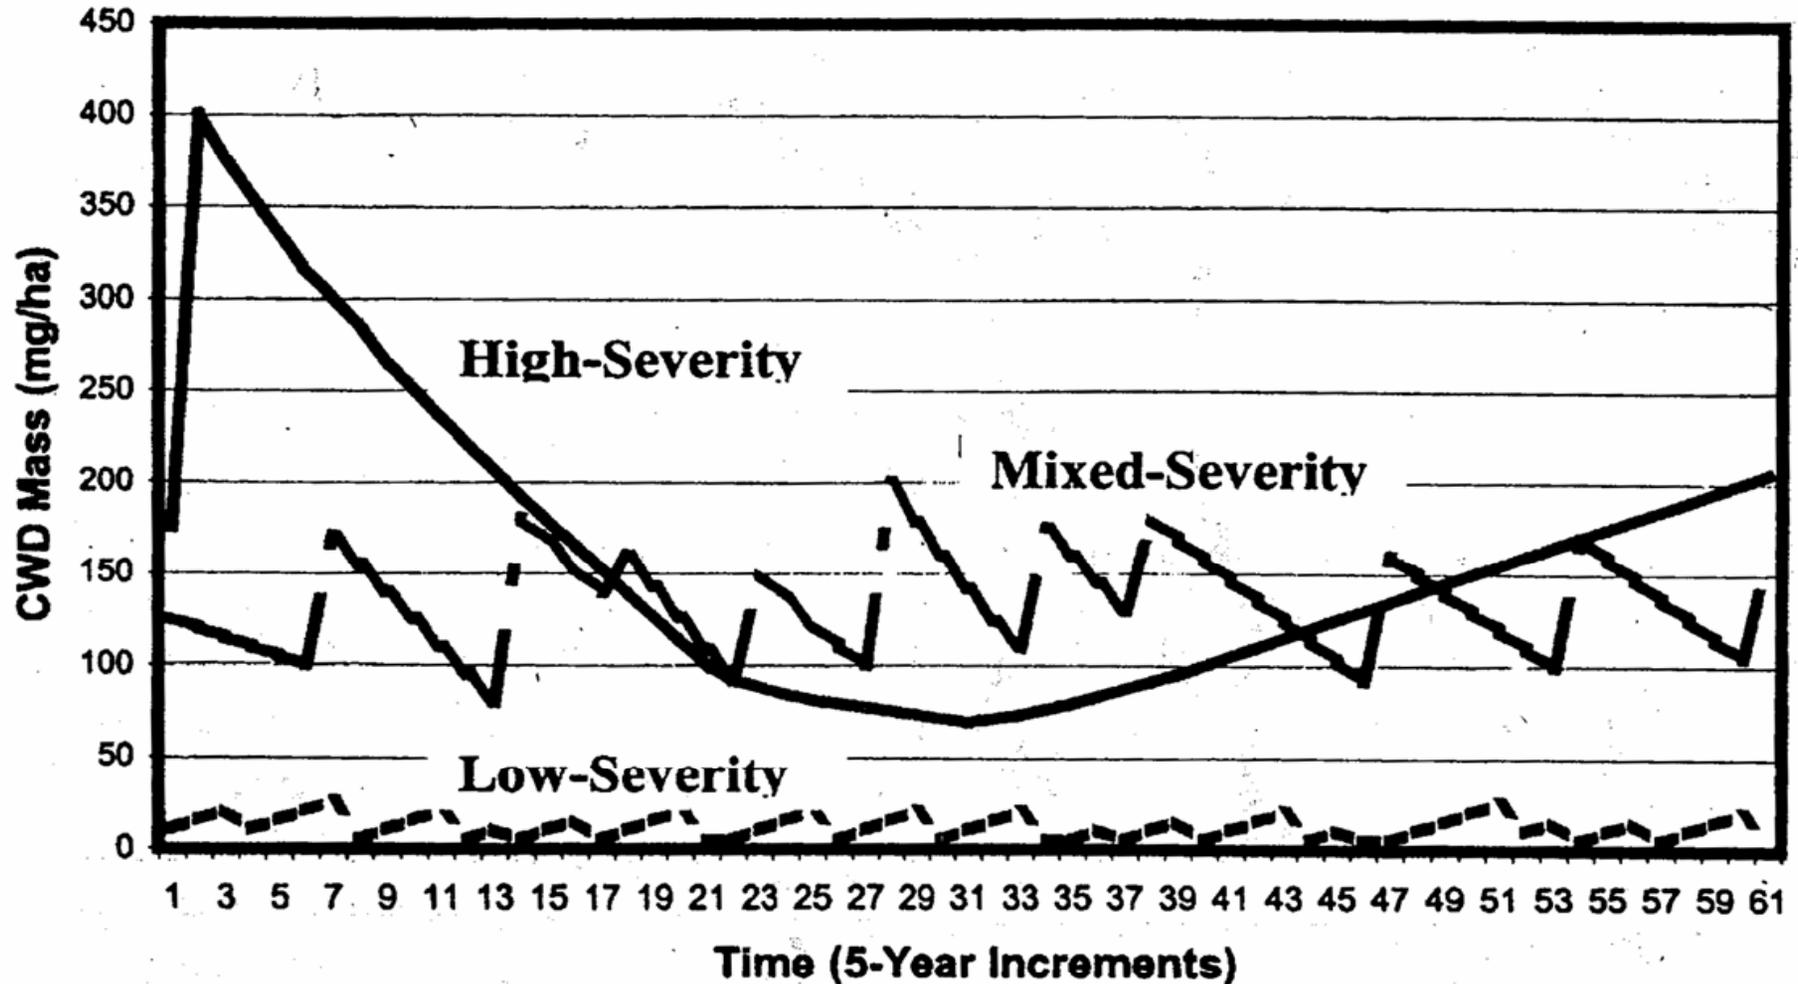

# CWD Over Time

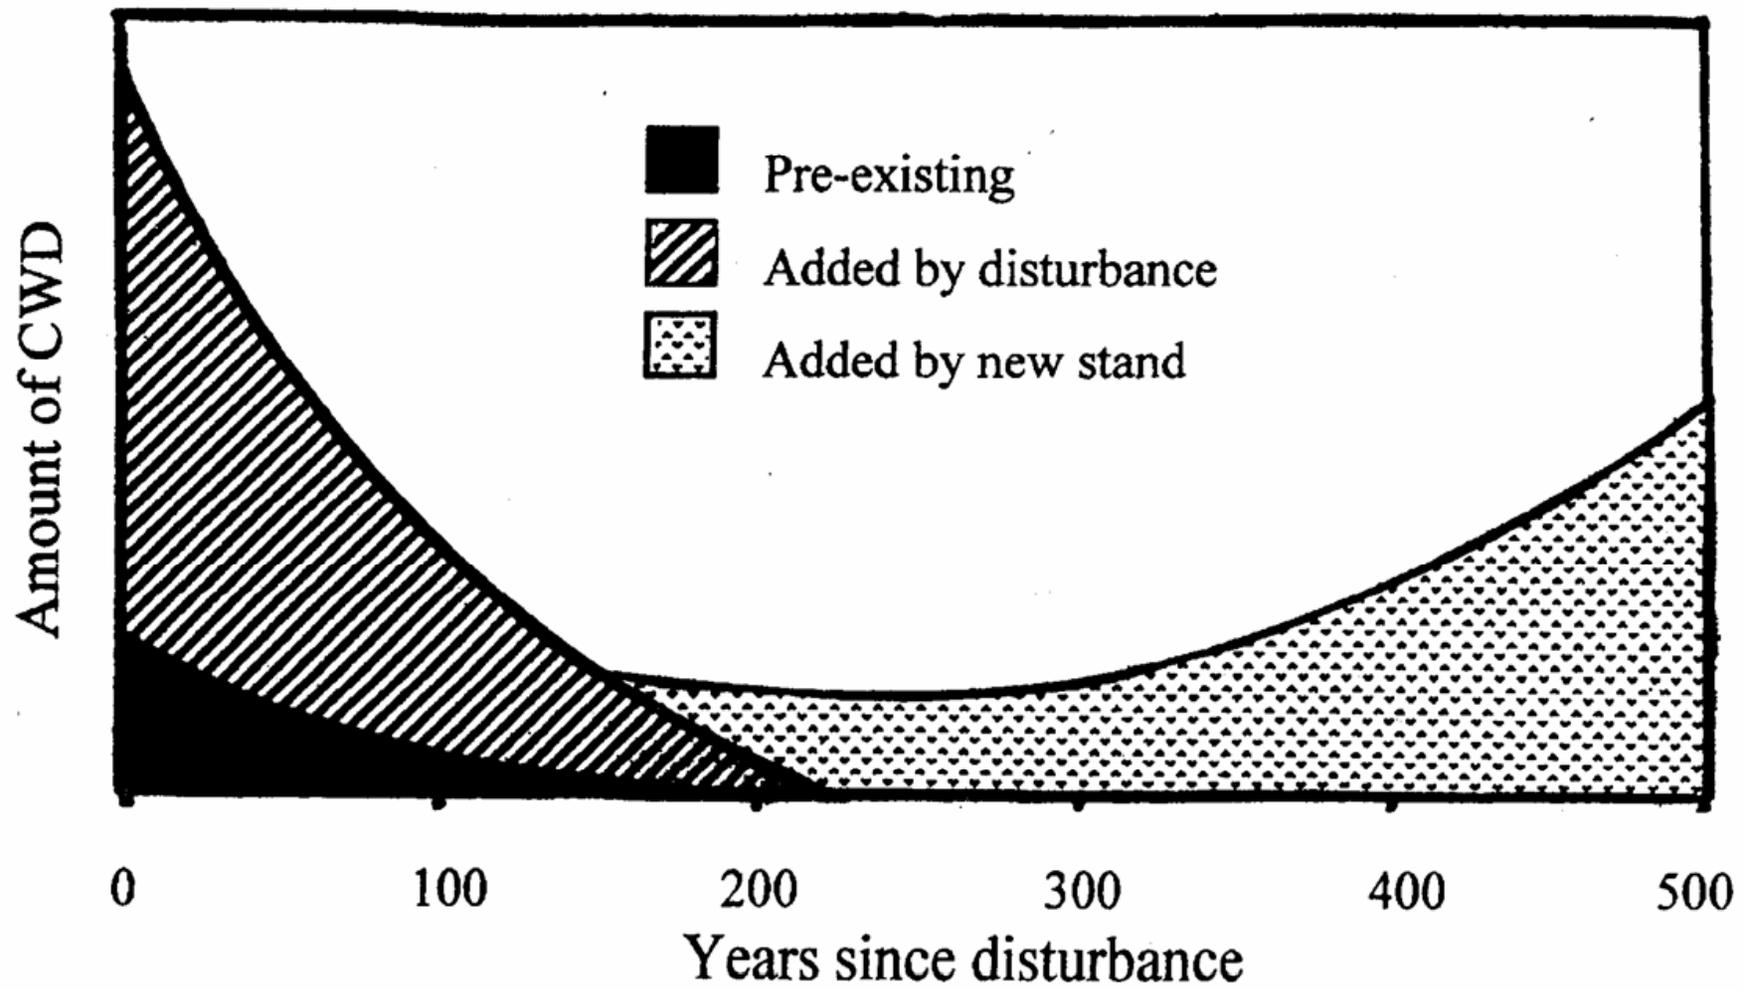

# CWD Over Time

# CWD Over Time

# Source of CWD

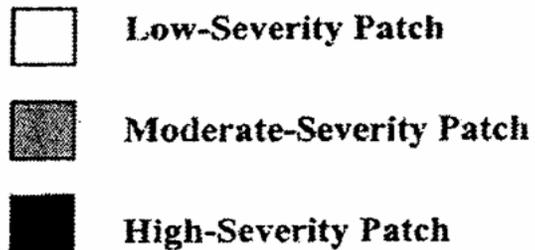

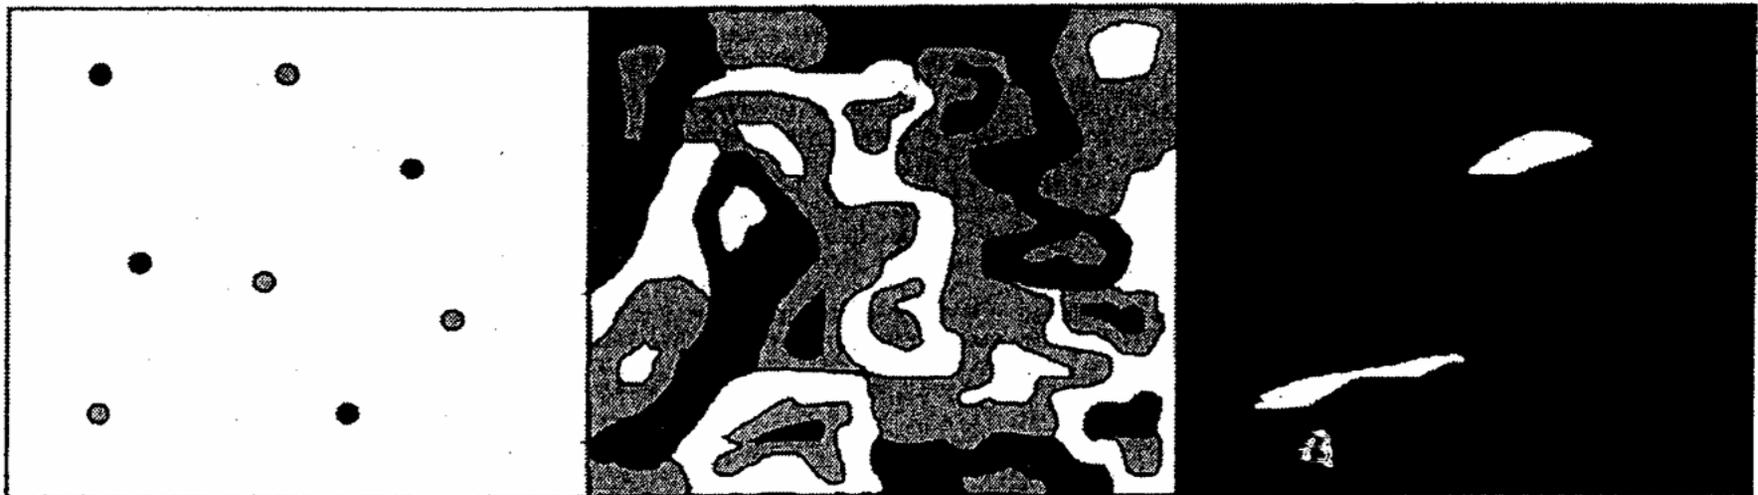

# Distribution Pattern Varies with Severity Regime

Low-Severity Fire Regime

Mixed-Severity Fire Regime

High-Severity Fire Regime

# **Enhances & Maintains Long Term Soil/Site Productivity**

- **Major reservoir & long-term source of nutrients & organic material**
- **Increased water holding capacity**
- **Promotes development of soil structure / better water infiltration & nutrient cycling**
- **Enhances soil cation-exchange capacity / enhances nutrient retention & availability**
- **Sites of nitrogen fixation by bacteria / gradual input accumulates over time**

# Biotic Diversity

- **Organisms that feed on the wood**
  - **Ants & Termites**
- **Microorganisms & fungi on the surface**
  - **Bacteria, Yeasts, & Micorhizae**
  - **Animals that eat microorganisms**
    - **Mites & beetles**
    - **Animals that eat these animals**
      - **Shrews, spiders, snakes, salamanders**

# **Biotic Diversity (continued)**

- **Plants that root on the log**
  - Hemlock, spruce, huckleberry, mushrooms
- **Animals that use logs for cover**
  - Rodents, snakes, salamanders, insects
- **Animals that eat detritus & feces from plants & animals**
  - Earthworms & mites

# Other Drivers of Disturbance

- Windthrow
- Disease
- Insects

# Conclusions

- We don't know all the answers
- We never will know all the answers
- No matter what you do, there will be winners and losers
- The best way to maximize biodiversity is to maximize habitat diversity:
  - at both the coarse - and fine - scales
- Decadence is the key to providing for many wildlife species
- Always hedge your bet!

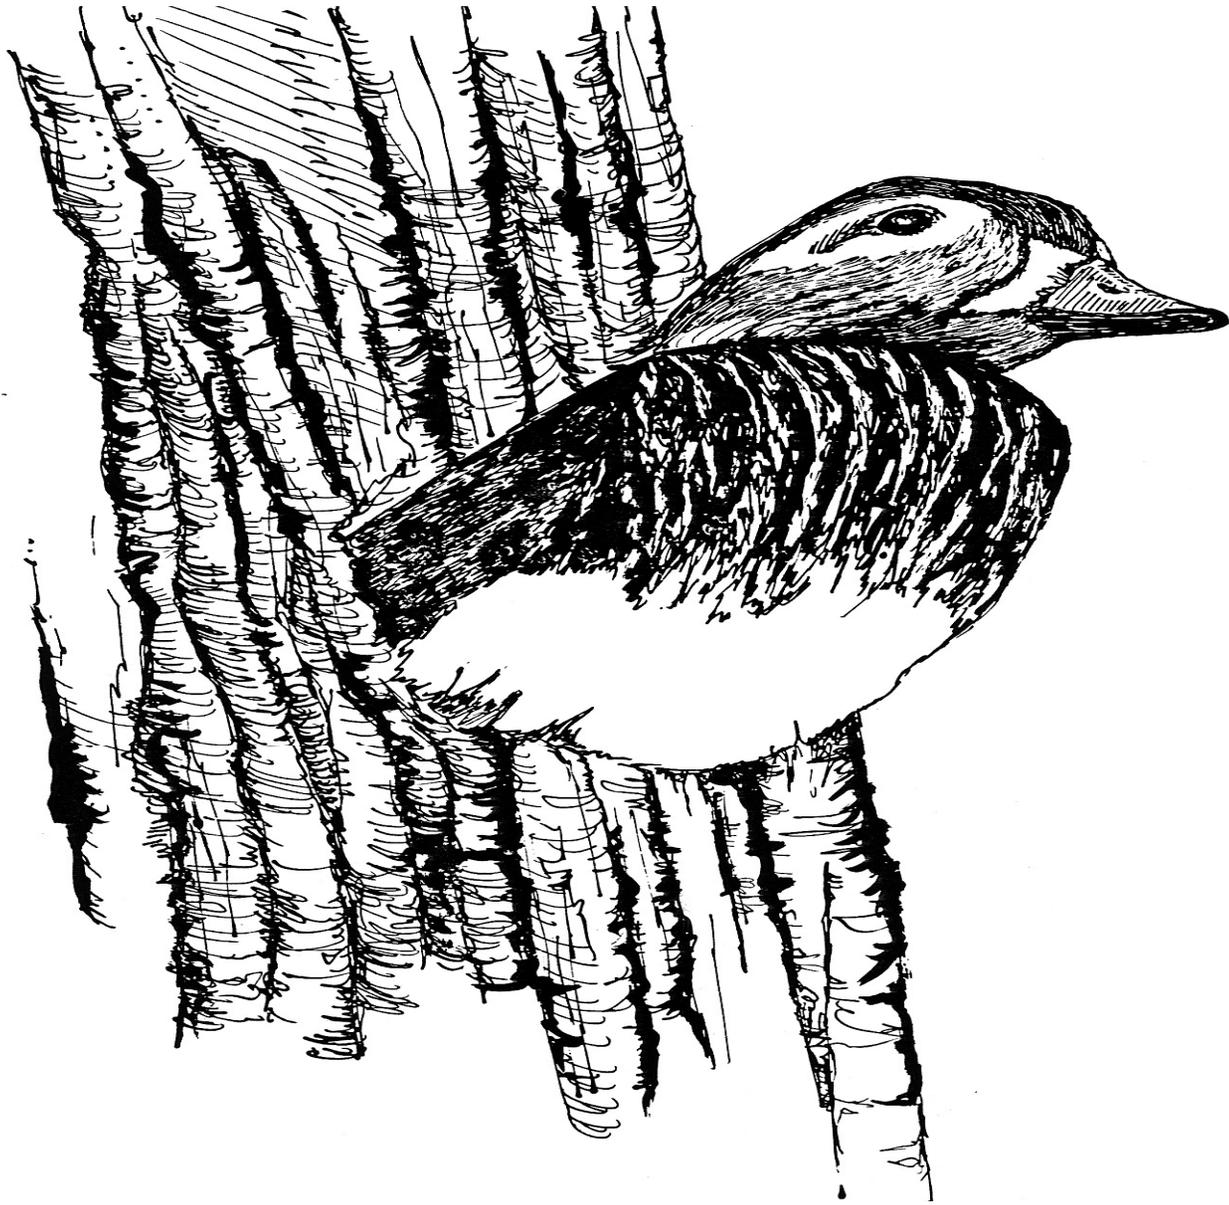

# Talking Points

**If you do the same thing everywhere,**

**No matter what you do,**

**You're not diversifying.**
