

So, in Lesson 2, Matt is going to show you how to conduct the impact analysis that you just planned, and by the end of the lesson you should be able to do the following things:

You should be able to identify potential impacts linking it to the element causing the impact; describe the context and severity of the impact; compare the effects of the action alternatives with the no-action alternatives; describe the analysis assumptions; and finally, to provide rationale for the conclusions.

Okay. Good luck with Lesson 2.
