

Rangeland Improvement Project System – RIPS Conclusion

Thank you for taking the introductory RIPS training. Through this training course, we have discussed how to create a new project record, how to edit an existing project record, how to create a maintenance record, how to abandon a range improvement project, and how to produce an assignment of range improvements report. Now that you've taken this training, please feel free to access RIPS in both the production and the test training environment. Remember, the test training environment is there for you to use and practice the features you've learned through this training course. If you have any questions regarding this or other RAS or RIPS training sessions, please contact one of the RAS or RIPS user reps. Leon Pack is located at the National Operations Center and has been a user rep for the RAS and RIPS systems since 1989. I am also located at the National Operations center and have been a user rep for these two systems since 2005. Again, thank you for taking this training course.
