How to Email Track Files or Waypoints!

This cheat sheet is designed to assist in transferring track or waypoint(marker) files via email between two users of Mat Tech Terrain Navigator Pro 6.04a. The starting point is that one user already has the track files or waypoint files in Terrain Navigator Pro.

Step 1: Have Terrain Navigator open to the project that has the tracks or waypoints(markers) that you want to send.

Step 2: Select **FILE**, and then **EXPORT** and choose either track file or Markers(waypoints).

Step 3: Highlight the track or waypoint files that you would like to transfer/email. You can select multiple tracks or markers (waypoints) by holding down control and clicking on multiple tracks or markers (waypoints).

Step 4: Choose a name and a location to save the desired tracks/markers (waypoints). It will automatically add the .TXF file extension for track files or .MXF file extension for waypoints.

Step 5: Attach the saved file to an email.

Step 6: To import the emailed file into Terrain Navigator Pro save the email attachment and then open Terrain Navigator Pro and select **FILE** and **IMPORT** and choose either the track file or marker (waypoint) file that you want to import and select **OPEN**. Note that marker (waypoint) files have the .MXF extension and track files have the .TXF extension.
